Time Warner Telecom Expands IP VPN Capabilities Nationwide

-- Increases customer reach nationwide; service scales to 1 Gbps --

LITTLETON, Colo. – June 6, 2006 – Time Warner Telecom Inc. (NASDAQ: TWTC), a leading provider of managed voice and data networking solutions for businesses, today announced 1 Gbps availability and nationwide reach for its IP VPN service to business customers.

The Time Warner Telecom MPLS, IP VPN solution is for enterprises looking to streamline their networks; to connect their headquarters, branch and satellite locations; and to connect various access technologies to a fully-integrated, easily-managed network backbone.

“Our VPN solutions suite is optimized to support a wide range of enterprise customers and their advanced intra-company applications requirements,” said Graham Taylor, senior vice president of Marketing at Time Warner Telecom. “We have solutions that can be tailor-made for these customers and help them converge their voice, data and Internet networks. We are offering customers more choice for their varied business critical applications.”

Time Warner Telecom’s MPLS, IP VPN solution is designed to meet a customer’s needs for convergence and end-to-end management of their service. Businesses can now better manage their voice and data applications, have the flexibility to add or make changes to their network configurations, and utilize the scalability to go from one to any number of locations. This service is cost effective, compared to traditional WAN technologies and is the preferred replacement for ATM or Frame Relay.

Time Warner Telecom has one of the newest fiber networks of any service provider in the country with approximately 21,000 route miles of fiber connected directly to approximately 6,200 buildings and a 10 Gbps IP backbone. As a result, Time Warner Telecom has the scalability to quickly add any VPN solution to meet specific customer needs.

- more -

Integrated media company, Fisher Communications, based in Seattle, is using Time Warner Telecom's MPLS, IP VPN service to deliver improved network efficiencies to seven of its 10 network-affiliated television stations.

Fisher had been exploring ways to improve the centralization of business applications, Internet access, and distribution management of all its video content and programming to locations in Washington, Idaho, and Oregon, from its Seattle location.

Time Warner Telecom designed and installed a three-state, seven-site VPN network solution, accessed through both Ethernet and private line services, to meet Fisher's network or applications requirements. This solution includes class of service capability, a VPN service-feature of growing importance for customers that allows them to prioritize certain IP traffic to meet their business needs.

Fisher expects to achieve capital and expense savings for the remote television stations, allowing these stations to serve their local markets, while simultaneously leveraging centralized content and resources from Seattle.

"We won this business based upon our knowledge and support for a new technology to our customer," Taylor added. "Equally as important was our commitment to work with Fisher Communications to meet their aggressive requirements for installation. We delivered it when they needed it, where they needed it and that's what customers are looking for from their service providers."

About Time Warner Telecom

Time Warner Telecom Inc., headquartered in Littleton, Colo., provides managed network services, specializing in Ethernet and transport data networking, Internet access, local and long distance voice, VoIP and security, to enterprise organizations and communications services companies throughout the U.S. As a leading provider of integrated and converged network solutions, Time Warner Telecom delivers customers overall economic value, quality, service, and improved business productivity.
